### General Construction Planning and Selection of Strategies to Control Erosion and Sediment on Highway Construction Projects

#### 1. General
- All highway construction projects shall be planned and designed to minimize erosion and sedimentation. This includes the selection of appropriate erosion control measures that are cost-effective and environmentally sound. The contractor is responsible for the selection and implementation of appropriate erosion control measures that are consistent with the project specifications and are compatible with the surrounding environment.

#### 2. Siting and Design
- The siting and design of the project shall consider the potential for erosion and sedimentation in the project area. This includes the selection of appropriate locations for access roads, temporary structures, and construction activities. The contractor shall be responsible for the proper siting of temporary structures and construction activities to minimize erosion and sedimentation.

#### 3. Erosion Control Practices
- Site preparation activities shall be coordinated with the erosion control practices to minimize erosion and sedimentation. This includes the selection of appropriate erosion control measures that are cost-effective and environmentally sound. The contractor is responsible for the selection and implementation of appropriate erosion control measures that are consistent with the project specifications and are compatible with the surrounding environment.

#### 4. Erosion Control Measures
- Table 1 summarizes the erosion control measures that are available for use on highway construction projects. The contractor shall be responsible for the proper selection and implementation of the appropriate erosion control measures that are consistent with the project specifications and are compatible with the surrounding environment.

#### 5. Maintenance and Inspection
- Maintenance and inspection of erosion control measures shall be conducted by the contractor to ensure that the measures are functioning properly and are effective in controlling erosion and sedimentation. The maintenance and inspection of erosion control measures shall be conducted in accordance with the project specifications and are compatible with the surrounding environment.

#### 6. Erosion Control During Construction
- Erosion control measures shall be in place during construction to minimize erosion and sedimentation. The contractor shall be responsible for the proper selection and implementation of the appropriate erosion control measures that are consistent with the project specifications and are compatible with the surrounding environment.

#### 7. Erosion Control During Design
- Erosion control measures shall be in place during the design phase to ensure that the measures are functioning properly and are effective in controlling erosion and sedimentation. The maintenance and inspection of erosion control measures shall be conducted in accordance with the project specifications and are compatible with the surrounding environment.

Note:
- The selection of initial material shall be based on the project specifications and the surrounding environment.
- The selection of traditional or modified materials shall be based on the project specifications and the surrounding environment.
- The selection of polymeric materials shall be based on the project specifications and the surrounding environment.

### Erosion Control During Construction
- Erosion control measures shall be in place during the construction phase to ensure that the measures are functioning properly and are effective in controlling erosion and sedimentation. The maintenance and inspection of erosion control measures shall be conducted in accordance with the project specifications and are compatible with the surrounding environment.

### Erosion Control During Design
- Erosion control measures shall be in place during the design phase to ensure that the measures are functioning properly and are effective in controlling erosion and sedimentation. The maintenance and inspection of erosion control measures shall be conducted in accordance with the project specifications and are compatible with the surrounding environment.

### State of New Hampshire
- The State of New Hampshire Department of Transportation - Division of Highways.

### Wetland Impact Plans
- This section details the procedures and requirements for wetland impact plans, including the selection of appropriate erosion control measures that are cost-effective and environmentally sound. The contractor shall be responsible for the proper selection and implementation of the appropriate erosion control measures that are consistent with the project specifications and are compatible with the surrounding environment.

---

1. All erosion control measures shall be designed and constructed to minimize erosion and sedimentation.
2. All erosion control measures shall be inspected and maintained in accordance with the project specifications and are compatible with the surrounding environment.
3. All erosion control measures shall be designed and constructed to minimize erosion and sedimentation.
4. All erosion control measures shall be inspected and maintained in accordance with the project specifications and are compatible with the surrounding environment.
